HydroControl VFC, VFN, VFR

Double regulating and commissioning valves PN 16/PN 25/PN 6, DN 20...400

The HydroControl VFx (short designation, representative of VFC, VFN und VFR) is a flanged double regulating and commissioning valve for the static hydronic balancing of pipelines in closed heating and cooling systems. It offers a measuring function via the valve seat.

The HydroControl VFx consists of a flow optimised Y-pattern body with flanged connection, a valve insert with double O-ring sealing, ergonomically designed handwheel, low pitch and sophisticated cone shaped plug as well as two Classic measuring valves. All functions are accessible from the top and include the following:

- Accurate flow regulation
- Reproducible, blockable and lead sealable infinitely adjustable presetting
- Pipeline shutoff
- Flow measurement connection
- Optional filling, bleeding and draining
- Optional connection of the impulse tube of a differential pressure regulator

Features

+ Complete portfolio up to nominal size DN 400
+ Flanges with hole circles according to EN1092-2 PN 16, PN 25, PN 6 or according to ANSI class 150
+ Made of cast iron, nodular cast iron or bronze

Variants

The HydroControl VFC is the standard valve with cast iron body. It is available in PN 16 up to DN 400 and in PN 6 or ANSI.

The HydroControl VFN is the PN 25 variant with nodular cast iron body.

The HydroControl VFR is a PN 16 variant with bronze body and bonnet. It is suitable for difficult media.

Technical Data

	HydroControl VFC	HydroControl VFN	HydroControl VFR
Nominal sizes	DN 20...400 ¾“ to 16“	DN 65...300	DN 50...200
Flange versions	According to EN 1092-2 PN 16[1] According to EN 1092-2 PN 6 According to ANSI class 150	According to EN 1092-2 PN 25	According to EN 1092-2 PN 16
Length	According to EN 558, basic series 1[2]		
Operating temperature	-10...150 °C	-20...150 °C	-20...150 °C
Operating pressure	Max. 16 bar Max. 20 bar for cold water With flanges PN 6: max. 6 bar	Max. 25 bar	Max. 16 bar Max. 20 bar for cold water
Medium	Heating and cooling water according to VDI 2035 or ÖNORM 5195 Water and glycol mixtures with a max. glycol content of 50%		Heating and cooling water according to VDI 2035 or ÖNORM 5195 Water-glycol mixtures with a max. glycol content of 50 % Cold salt water up to 38 °C Service water
Kvs values	4.8 to 3,750	98 to 1,600	36 to 815
Storage temperature	-20...60 °C		

Functions

Flow regulation

Flow regulation is done by limiting the valve lift and hence the opening between plug and seat. The low pitch allows very precise setting. The plug position is displayed on a scale on the handwheel. This value is the presetting value.

The HydroControl has an almost linear characteristic line and a wide flow range evenly graded over all nominal sizes. As is typical for regulating valves, the control quality decreases the smaller the opening is between plug and seat. Very small presettings are therefore not recommended for the HydroControl and are generally not specified.

Presetting

- Infinitely: all intermediate values are adjustable
- Reproducible: when the valve is closed, it can only be opened up to the set presetting value
- Blockable: Valves up to and including DN 50 can be blocked at the presetting position, i.e. locked against opening or closing. Blocking set item no. 1060180 is required for this (see chapter Accessories, further on)
- Lead sealable: the valve can be additionally lead sealed, e.g. with lead sealing wire (item no. 1089091, see chapter Accessories, further on)

Shutoff

Turning the handwheel clockwise until it stops shuts off the pipeline tightly.

[1] EN 1092-2 PN6 / PN16 / PN25 corresponds to ISO 7005-2 PN 6 / PN 16 / PN 25

[2] EN 558, basic series 1 corresponds to ISO 5752, series 1

Flow determination

Each HydroControl VFx is equipped with two Classic measuring valves in order to be able to measure the differential pressure and thus determine the flow rate. The Oventrop OV-DMC 3 measuring device contains the required measuring needles and the characteristic lines of all HydroControl VFx are stored as standard.

Due to the patented measuring arrangement (measuring chamber is routed around the valve insert to the measuring connection), the pressure difference measured at the measuring valves almost matches the actual pressure difference of the valve.

FILLING, DRAINING AND BLEEDING

For filling, draining and bleeding, one or both Classic measuring valves can be replaced with fill and drain ball valves. For replacement, the valve must be depressurised. To ensure tightness, use the fill and drain ball valve, item no. 1060191, which is available as an accessory.

A flow determination can still be carried out, as the necessary adapters for connection to fill and drain ball valves are included with the OV-DMC 3 measuring device.

IMPULSE TUBE CONNECTION

To connect an impulse tube, one of the measuring valves must also be replaced with a fill and drain ball valve. The impulse tube of the differential pressure regulator is connected to the hose connection of the fill and drain ball valve. Flow determination by the HydroControl VFx is then only possible with a separate measuring adapter (item no. 1060299, see chapter Accessories, further on).

CONNECTION OF AN OV-DMC 3

The measuring hoses of an OV-DMC 3 measuring device can be connected to the Classic measuring valves with needle adapters. The needle adapters are supplied with the OV-DMC 3.

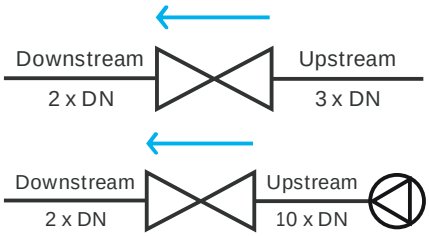
All specifications in mm.

Installation



- Calming sections of 3 x DN upstream and 2 x DN downstream of the valve should be provided.
- When installing directly downstream of a pump, a calming section of 10 x DN should be provided.
- The valve must be installed correctly in the flow direction which is indicated by an arrow on the body.

Accessories

Thermal insulation shell

Made of polyurethane rigid foam with polystyrene shell. For heating and cooling systems. Operating temperature -10 to to 130 °C. Building material class B2 according to DIN 4102. Complies with the German Energy Saving Ordinance (EnEV) according to appendix 5, table 1, line 5. Cold insulation: Min. medium temperature 6 °C, shells have to be bonded hermetically. Restricted diffusion tightness at low medium temperature and at high ambient temperature and/or air humidity.

	DN 32	1069010
	DN 40	1069012
	DN 50	1069016

Sizing

This data sheet offers you various options to size your HydroControl VFx:

- Use the alignment chart below for a quick sizing across all nominal sizes.
- Use the Kv value tables and flow charts in the "Flow data" section for an accurate determination of the presetting value.
- At the end of the data sheet you will find information on the exact Kv value calculation taking into account the medium temperature. Furthermore, you will find information on the approximate calculation of corrected flow values when using glycol mixtures.

Alignment chart

The alignment chart allows you to graphically determine the Kv value. Draw a line and place it so that it crosses the desired flow rate (1) on the left scale and the available differential pressure (2) on the right scale - in the example below it is the blue line that crosses the respective scales at 100 m³/h and 20 kPa. Now you can read off the Kv value (3) from the middle scale, in this case 223.

If you draw a line from the Kv-value scale to the right (in the example below, the grey line), you will immediately see which nominal sizes come into question for the required flow rate. For a Kv value of 223, DN 125 to DN 250 are possible. Since control and regulating valves are reluctant to operate at the lower end of their capacity, DN 300 should not be selected.

Kv value calculation

The flow coefficient Kv is the volume of water in m³ that flows through an opening within one hour with a pressure loss of 1 bar. For control and regulating valves, this opening is typically the gap between the valve seat and the valve plug. The required Kv value can be easily calculated with the Kv formula:

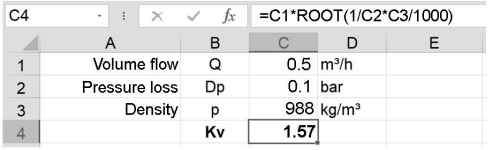
$$Kv = Q \times \sqrt{\frac{1\,bar}{\Delta P} \times \frac{\rho}{1000\frac{kg}{m^3}}}$$

- Q is the volume flow in m³/h
- ΔP is the pressure loss in bar
- ρ is the density in kg/m³ — water with a temperature of 4 °C has a density of 1,000 kg/m³. At 50 °C water has a density of 988 kg/m³, at 70°C of 978 kg/m³ and at 100°C of 958 kg/m³

For use with Excel or other spreadsheets, the formula is:

=Q*ROOT((1/DP)*(ρ/1000))

The objects in semibold cyan are to be replaced by values or cell references. Brackets have been added for easier mapping.



For an accurate Kv value calculation, you need the water temperature so that you can look up the density and enter the value into the formula. If a less precise calculation is sufficient, the formula can be simplified by shortening the second fraction by setting the density to 1,000 kg/m³ - which only applies to a water temperature of 4 °C, as mentioned above. The error in a Kv value calculated in this way is approx. 1 % for water with a temperature of e.g. 70 °C (density 978 kg/m³).

To be calculated	Formula	Spreadsheet formula
Kv value (simplified)	$Kv = Q \times \sqrt{\frac{1\,bar}{\Delta P}}$	=Q*ROOT(1/DP)

Correction factors

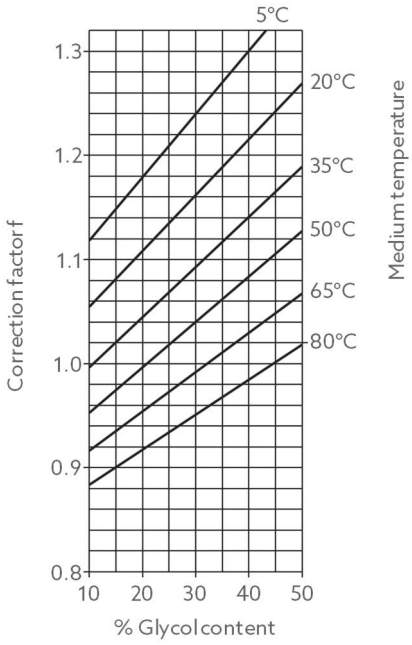
Additives change the viscosity of water and thus its flow properties. Manufacturers of additives often provide calculation aids that take into account the changed properties of the medium when using their products.

The flow data in this data sheet are based on the properties of water without additives. A quick, but only approximate calculation of the changed flow values when using glycol mixtures is made with the correction factor f, which can be used to recalculate the Kv value or the required pressure loss:

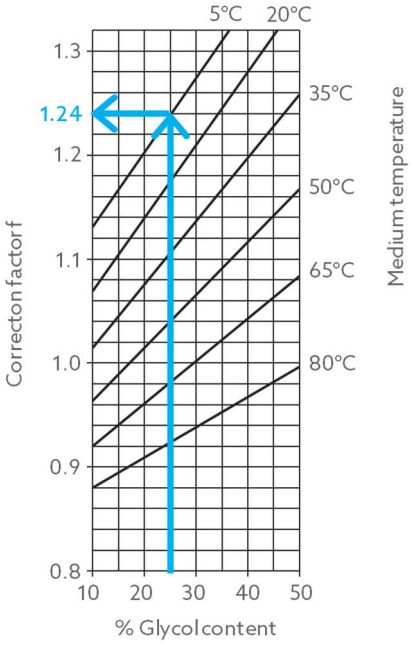
To be calculated	Formula	Spreadsheet formula
Kv value (corrected)	$Kv_{(corr)} = Kv \times \frac{1}{\sqrt{f}}$	Kv*(1/(ROOT(f)))
Pressure loss (corrected)	$\Delta P_{(corr)} = \Delta P \times f$	DP*f

The correction factor can be read in the following two charts at the intersection of the values for media temperature and glycol content.

Subject to change without notice • All rights reserved



Correction factor f for ethylene glycol



Correction factor f for propylene glycol

Example:

A glycol content of 25 % and a medium temperature of 5 °C result in a factor of 1.24 with the following impacts:

- If the original Kv value was 10, it is now reduced to just short of 9
- If the original flow rate was 10 m³/h, it is now reduced to just short of 9 m³/h (at the same differential pressure)
- If the original differential pressure was 10 kPa, it must now be increased to 12.4 kPa to ensure the same flow rate
